

HSL COLOR WHEEL CHART

CMYK

C = 0
M = 0
Y = 100
K = 0

RGB

R = 255
G = 255
B = 0

HSL

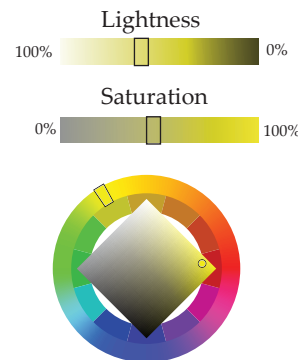

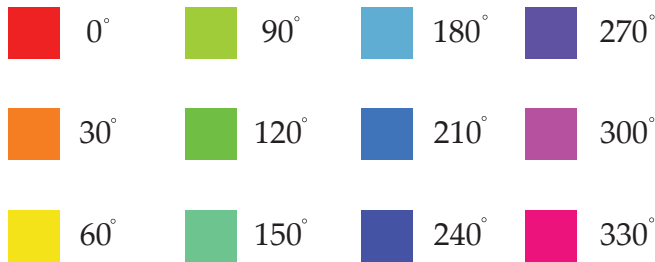

H = 60°
S = 100%
L = 50%

The HSL (Hue, Saturation, Lightness) model represents colors intuitively:

Hue: Angle from 0° to 360°, indicating the color (e.g., 0° = red, 120° = green, 240° = blue).

Saturation: Percentage from 0% (gray) to 100% (full color intensity).

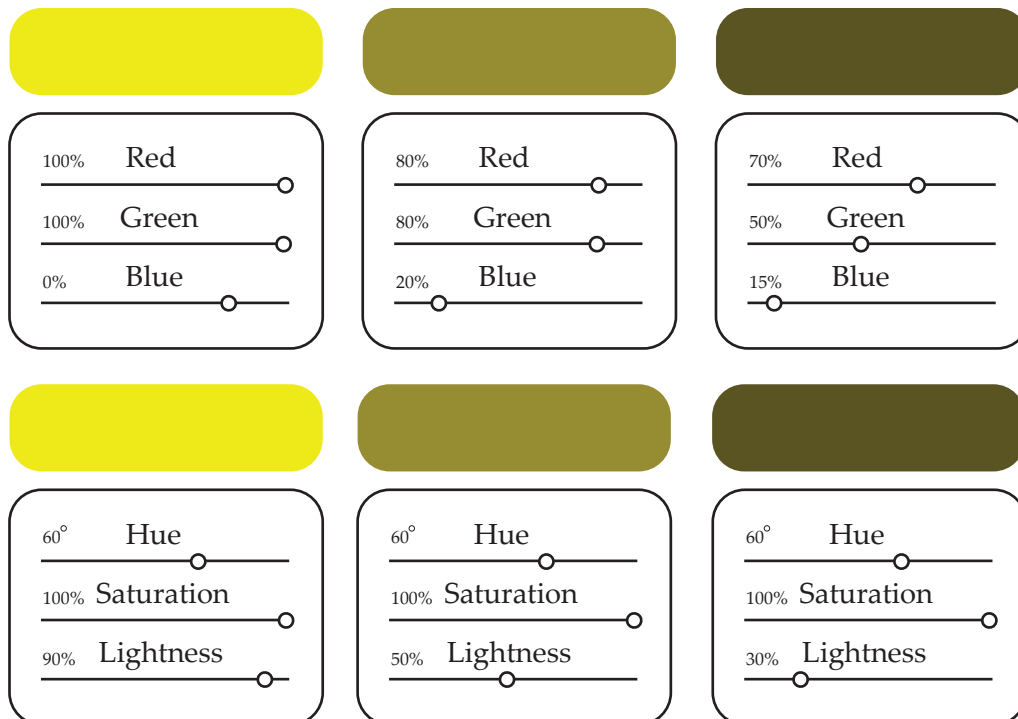

Lightness: Percentage from 0% (black) to 100% (white). HSL allows easy adjustments of color by changing these values, making it user-friendly for design and artistic applications.

This diagram demonstrates how HSL sliders affect color: moving the lightness slider from 100 to 0 shifts yellow from light to dark, while adjusting saturation reduces intensity, turning yellow to gray. Saturation here indicates color intensity, while lightness controls the depth, ranging from bright to dark tones

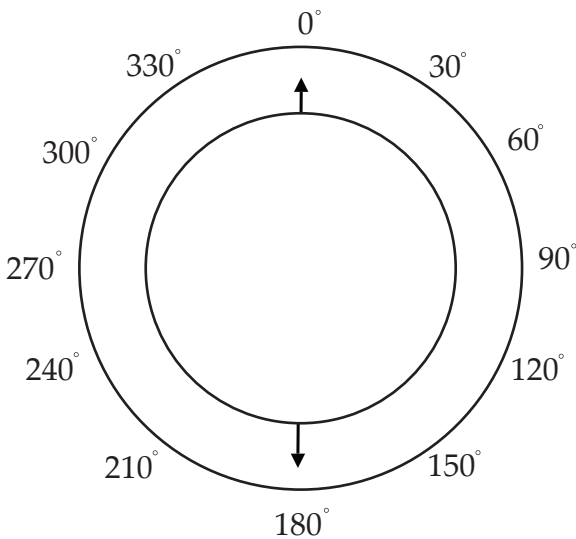

RGB

HSL

This chart illustrates how to create different shades of yellow using HSL and RGB. By adjusting the lightness in HSL, users can easily achieve yellow, dark yellow, and very dark yellow. In contrast, RGB requires changing multiple values to achieve similar shades. This demonstrates HSL's straightforward approach to color manipulation, making it simpler for users to create various color shades.
